## Coupling Relays with Narrow Type of Construction

### Relay connectors

#### Overview

##### AC and DC operation

DIN VDE 0110 Part 1, DIN VDE 0435, DIN VDE 0660 and EN 50005

In the coupling elements in double-decker format, the connections are arranged on two levels; the units are extremely compact. Connection method: screw-type connection or spring-loaded terminal. For test purposes, versions are available with manual 0 automatic switches.

The input and output coupling elements differ with regard to the positioning of the terminals and the LEDs. For equipment identification purposes, each coupling element has a blank legend plate.

In accordance with the technical specifications of electronic systems, the coupling elements have a lower power consumption.

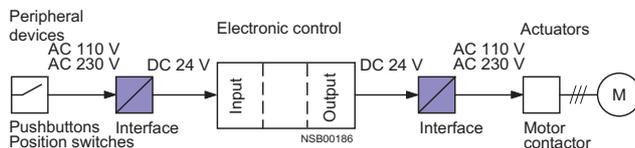

#### Design

##### Note on mounting

Snap-on mounting is possible on horizontal and vertical rails. In the case of vertical rails and closely mounted units, the maximum permissible ambient temperature  $T_u = 40\text{ °C}$ . Any service position is possible.

If the coupling elements are operated continuously 24 hours per day (100% ON time) at the maximum permissible rated control supply voltage and the maximum permissible ambient temperature, it is recommended that no similar equipment or other units that generate heat are placed directly adjoining the coupling elements because this can reduce the service life of the couplers.

A clearance of  $> 10\text{ mm}$  to the right and left of the coupling element reduces the risk of a premature failure under these conditions of application.

#### Functions

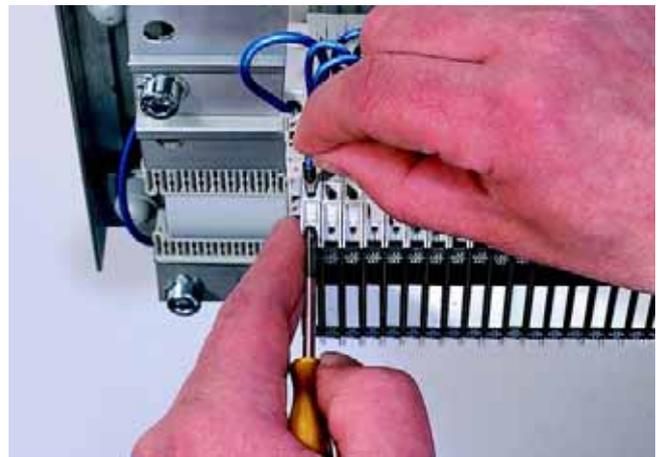

##### Surge suppression

The coupling links have been tested with  $1 \times 10^5$  operating cycles at AC-15 operation with the values specified in the Technical specifications.

If inductive loads are connected, the service life of the relay connectors can be increased.

##### Note:

*If capacitive loads without series resistors are switched, which limit temporary peak currents, microscopic welding of the relay contacts may result.*

Connecting a lead to the spring-loaded terminals

*Note: If inductive loads are connected in parallel, the service life of the relay connectors can be increased.*

1) No safe isolation for 3TX7 00.-1FB02

2) Capacitive loads can result in micro-welding on the contacts

3TX7 002

3TX7 003

#### Note:

For coil voltages which are not listed, see DC power supplies SITOP power e.g. 6EP1 331-2BA10 and 6EP1 731-2BA00 in "Transformers and power supplies".

- 1) The same potential must be applied to 2 NO/2 CO relays.
- 2) Observe max. permissible conductor length, see Technical specifications.

# Coupling Relays and Converters

## Coupling Relays with Narrow Type of Construction

### Plug-in relay connectors

#### Benefits

The wire is fed in and screwed down from the front. This results in faster wiring time and wiring errors are prevented.

#### Overview

Coupling elements are used to connect signals to and from a PLC. The plug-in relays enable the relay to be replaced at the end of its service life without the need for any changes in the wiring.

For easy bridging of the signals, each terminal can be jumpered using an external connecting comb.

| - AC-15   | - at 24 V<br>- at 110 V<br>- at 230 V             | A                    | 3  |
| - DC-13   | - at 24 V<br>- at 110 V<br>- at 230 V             | A                    | 1<br>0.2<br>0.1  |
| • Operating voltage   | AC/DC   | V                    | 24 ... 250   |
| • Min. contact load   | - standard contact<br>- hard gold-plated contacts |                      | AC/DC 17 V, 5 mA at 1 ppm fault <sup>2)</sup><br>AC/DC 5 V, 1 mA for 1 ppm fault <sup>2)</sup> |
| • Mechanical endurance  | Operating cycles                                  |                      | 20   |
| • Electrical endurance for $I_e$ acc. to AC-15  | Operating cycles                                  |                      | 100000   |
| • Operating frequency   | Operating cycles<br>1/h                           |                      | 5000   |

Note: If inductive loads are connected in parallel, the service life of the relay connectors can be increased.

1) Capacitive loads can result in micro-weldings on the contacts

2) 1 ppm = one fault per one million operating cycles.

#### Note:

Start of delivery of the socket interfaces with screw-type connection, expected at the beginning of 2004, units with spring-loaded terminals at the end of 2004.

1) The variants with hard gold-plated contacts with high contact reliability (also for low currents) are especially suitable for electronic inputs of programmable logic controllers.

2) The order number is **not** printed on the relays.

# Coupling Relays and Converters

## Coupling Relays with Narrow Type of Construction

### Semiconductor couplers

#### Area of application

##### AC and DC operation

DIN VDE 0110 Part 1, DIN VDE 0435, DIN VDE 0660 and EN 50 005 optocoupler: DIN VDE 0884, DIN VDE 0411 Part 500, IEC 61131-2 (programmable logic controllers).

In the coupling elements in double-decker format, the connections are arranged on two levels; the units are extremely compact. Connection method: screw-type connection or spring-loaded terminal. For test purposes, versions are available with manual 0 automatic switches.

The input and output coupling elements differ with regard to the positioning of the terminals and the LEDs. For equipment identification purposes, each coupling element has a blank legend plate.

In accordance with the technical specifications of electronic systems, the coupling elements have a lower power consumption.

#### Design

##### Note on mounting

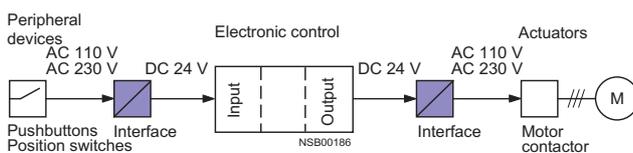

Snap-on mounting is possible on horizontal and vertical rails. In the case of vertical rails and closely mounted units, the maximum permissible ambient temperature  $T_u = 40\text{ }^\circ\text{C}$ . Any service position is possible.

If the coupling elements are operated continuously 24 hours per day (100% ON time) at the maximum permissible rated control supply voltage and the maximum permissible ambient temperature, it is recommended that no similar equipment or other units that generate heat are placed directly adjoining the coupling elements because this can reduce the service life of the couplers.

A clearance of  $> 10\text{ mm}$  to the right and left of the coupling element reduces the risk of a premature failure under these conditions of application.

Optocouplers switch using semiconductors. These are not subject to wear; welding is not possible.

The 6.2 mm wide optocouplers have an opening in the right-hand side of the casing. They can, like relay connectors, be mounted side-by-side without gaps.

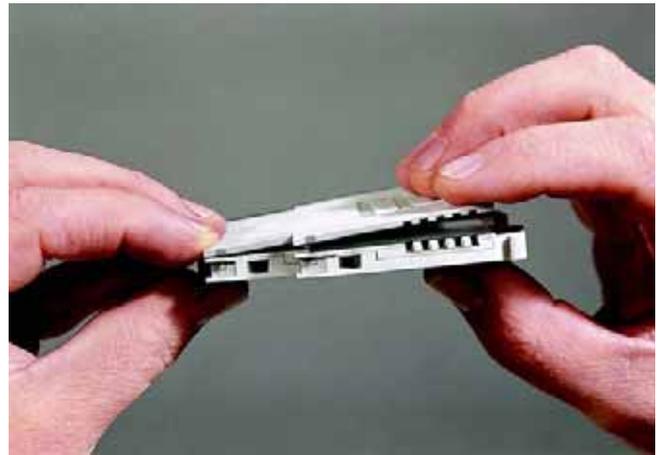

#### Functions

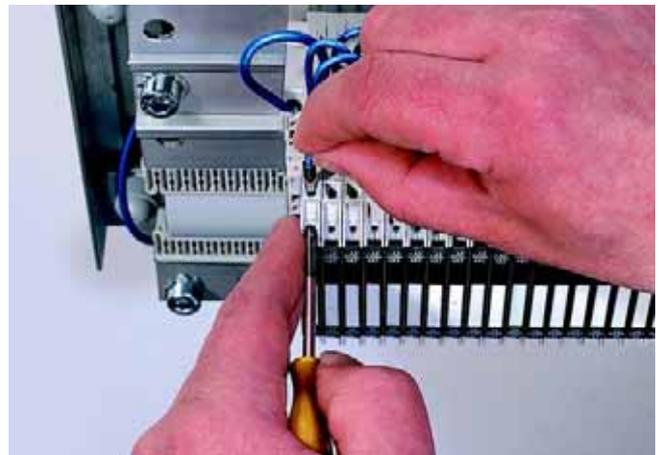

##### Surge suppression

In the case of optocouplers, the contact element is a semiconductor. These are not subject to wear; so welding is not possible.

With semiconductors, the switching current is not dependent on the inductance of the load, i.e. the switching current for a DC-13 load is the same as that for an inductive DC-12 load. This means that coupling elements with a semiconductor output are particularly suitable for inductive loads such as solenoid valves. It is not relevant to specify the number of operating cycles because this does not affect the service life of the semiconductor provided it is not overheated.

To provide shock-hazard protection in the case of modules of 6.2 mm width (e.g. 3TX7 004-3AB04) with an opening in the casing, the single module or the last module in a row must be fitted with a cover plate.

Connecting a lead to the spring-loaded terminals

1) In the event of a short-circuit or overload, the semiconductor output switches off. In order to operate the unit again, it must be temporarily disconnected from the power supply.

2) In the event of a short-circuit or overload, the current is limited by the semiconductor output.

3) If the current falls below the minimum load current, the built-in semiconductor detects an open-circuit in the load circuit. The control must be temporarily switched off for resetting.

#### Note:

For replacement products, see interfaces with 3RS18 industrial enclosure or other 3TX70 products.

For coil voltages which are not listed, see DC power supplies SITOP power e.g. 6EP1 331-2BA10 and 6EP1 731-2BA00 in "Transformers and power supplies".

1) Discontinued products: will no longer be manufactured from the beginning of 2004.

# Coupling Relays and Converters

## Coupling Relays in Industrial Enclosure

### Relay connectors

#### Overview

The new 3 RS18 coupling relays are couplers in the well-proven standard 22.5 mm time-delay relay enclosure. The series comprises relays with 1, 2 and 3 changeover contacts with screw-type and spring-loaded terminals for combined voltages and wide voltage ranges.

#### Benefits

- Wide voltage range: one product for all voltages
- The industrial enclosure supports the same connection methods as the time-delay relay including spring-loaded terminals, 2 wires can be clamped
- Versions with electronically optimized outputs (gold-plated)
- Up to 3 changeover contacts with only 22.5 mm width.

#### Area of application

Typical applications are found wherever electronically optimized contacts are required and equipment with a wide voltage range is implemented.

1) Hard gold-plated.

#### Design

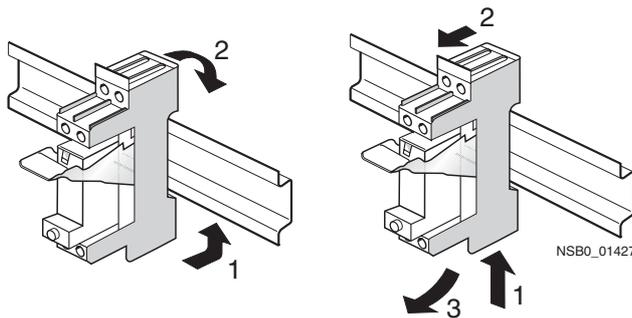

Plug-in relay coupling elements can be ordered complete or as single modules.

#### Mounting

The relays are plugged into the socket and this is snapped onto the 35 mm EN 50022 standard rail.

#### Note:

*For the plug-in relay coupling elements LZX of Series RT, the spring element must be hung onto the standard rail from below and fixed in place.*

A fixing bracket can be ordered for the MT series that additionally fixes the relay into a plug-in socket (under conditions of increased mechanical stress). For the RT and PT series, a combined fixing and ejection bracket is available which can be used to remove the relay where access is difficult, for example, when relays are mounted side-by-side.

They can be mounted as required.

#### Functions

In accordance with the technical specifications of electronic systems, the coupling elements have a lower power consumption. In the versions equipped with LEDs, these indicate the switching status. The LZX:PT/MT relay connectors have a test button. This can be used to force the relay connector into the tripped state and to lock it. This is indicated by a raised orange-colored lever.

#### Surge suppression

The 24 V DC relays LZX:RT and LZX:PT with LEDs can be supplied with, all others without integral surge suppression (free-wheeling diode connected in parallel with A1/A2). The positive supply voltage must be connected to coil terminal A1.

#### Logical disconnection

The terminals for the contacts and the terminals for the coil are arranged on separate levels, e.g. above for contacts and below for coil. Logical disconnection is not identical to safe isolation.

#### Safe isolation

For safe isolation, transfer of the voltage of one circuit to another circuit is prevented to a suitable degree of safety (see DIN VDE 106, Part 101).

1) AC voltages, 50 Hz; for 60 Hz operation, the lower response value must be increased by 10 %; the power loss will be reduced slightly.

2) The max. conductor length depends on the conductor capacity and the cable installation. It can be increased by means of parallel load on A1/A2.

3) Capacitive loads can result in micro-weldings on the contacts.

1) AC voltages, 50 Hz; for 60 Hz operation, the lower response value must be increased by 10 %; the power loss will reduce slightly.

2) The max. conductor length depends on the conductor capacity and the cable installation. It can be increased by means of parallel load on A1/A2.

3) Capacitive loads can result in micro-weldings on the contacts.

#### Note:

Logical isolation: the terminals for the contacts and the terminals for the coil are arranged on separate levels, e.g. above for contacts and below for coil. Logical isolation is not identical to safe isolation.

Safe isolation: safe isolation prevents voltage of one circuit affecting another circuit with sufficient protection (DIN VDE 106 Part 101).

#### Note:

For coil voltages which are not listed, see DC power supplies SITOP power e.g. 6EP1 331-2BA10 and 6EP1 731-2BA00 in "Transformers and power supplies".

1) The test bracket is designed to be non-latching. If the test bracket is pressed further until 90° has been reached, two small lugs break off and the test bracket can be latched in position.
